When agents write the code, what do we do together?

The keyboard used to give us a place to meet.

Give the agent the context a colleague would need.

The task already has a history. Let the agent read it.

Shared context.
For people and agents.

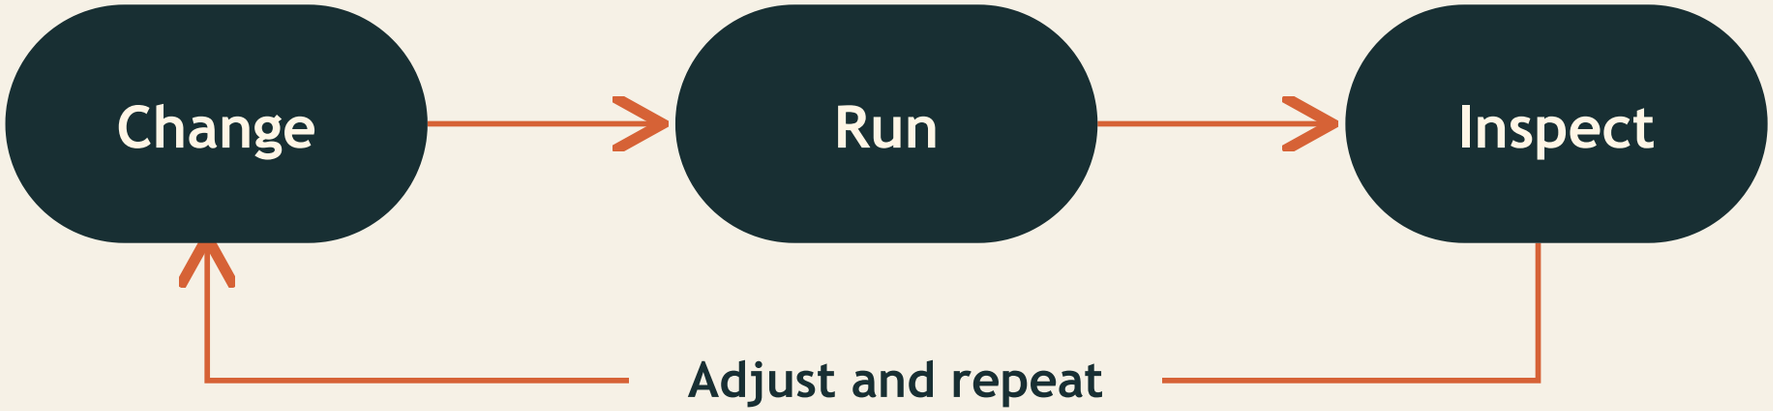

Illustrative scene · AI-generated

- What are we trying to achieve?
- Which decisions apply?
- How will we know it is good?

Shape it together. Keep the agent in the conversation.

Let the agent see whether it worked.

A clear goal. Room to act. A way to check.

A little pixel pushing.

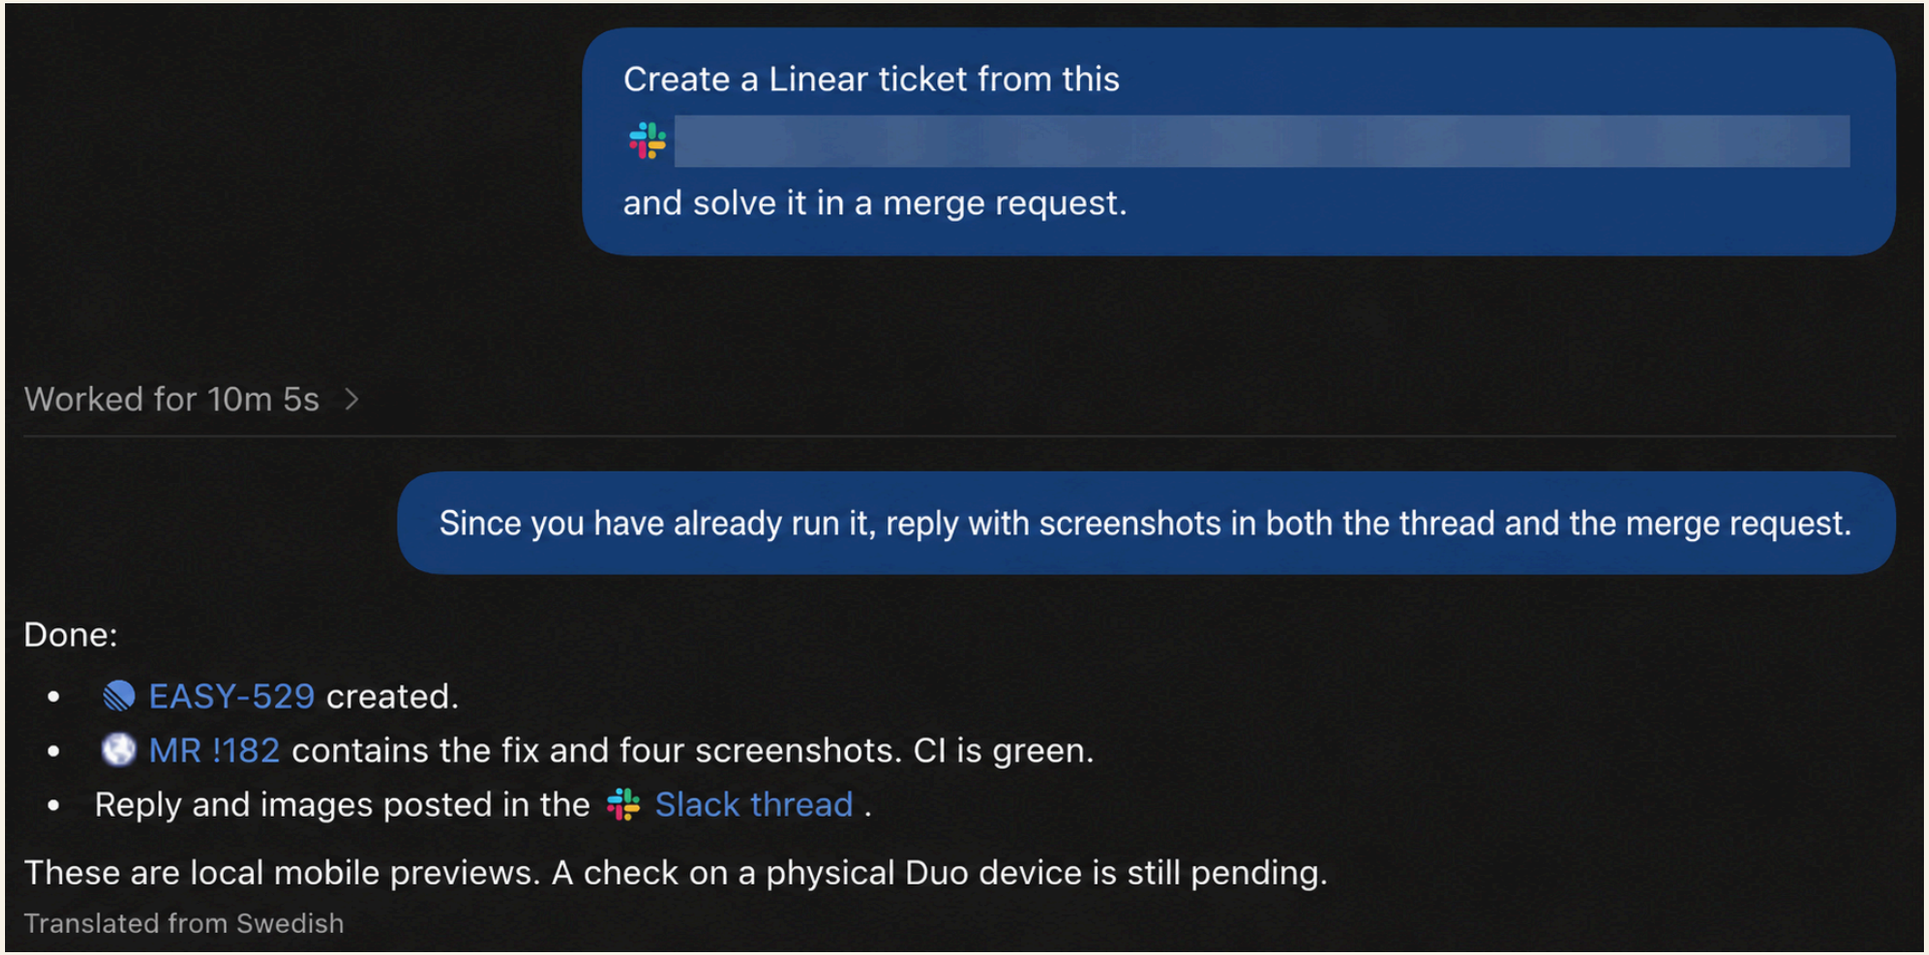

One border colour.

One text that doesn’t fit.

The context is already in the thread.

English recreation of the Swedish thread. Product UI remains Swedish.

“Solve it. Then show us.”

Two instructions: make the change, then bring the evidence back to the team.

The result returns to the conversation.

Fixed in MR !182, linked to EASY-529.

Inactive code fields now use Warm Gray 400 (#b7b4ad) in light mode. The placeholder has been changed to “Your guardian’s email address” both on initial entry and when changing the address.

The images above show real Flow components in light/dark mode, rendered locally at mobile width (390 px) with test data. The same images are in the MR. The placeholder fits at this width. The build and 27 targeted component tests pass. A visual check in Duo on a physical device is still pending.

I can take a look in Duo once it is available there.

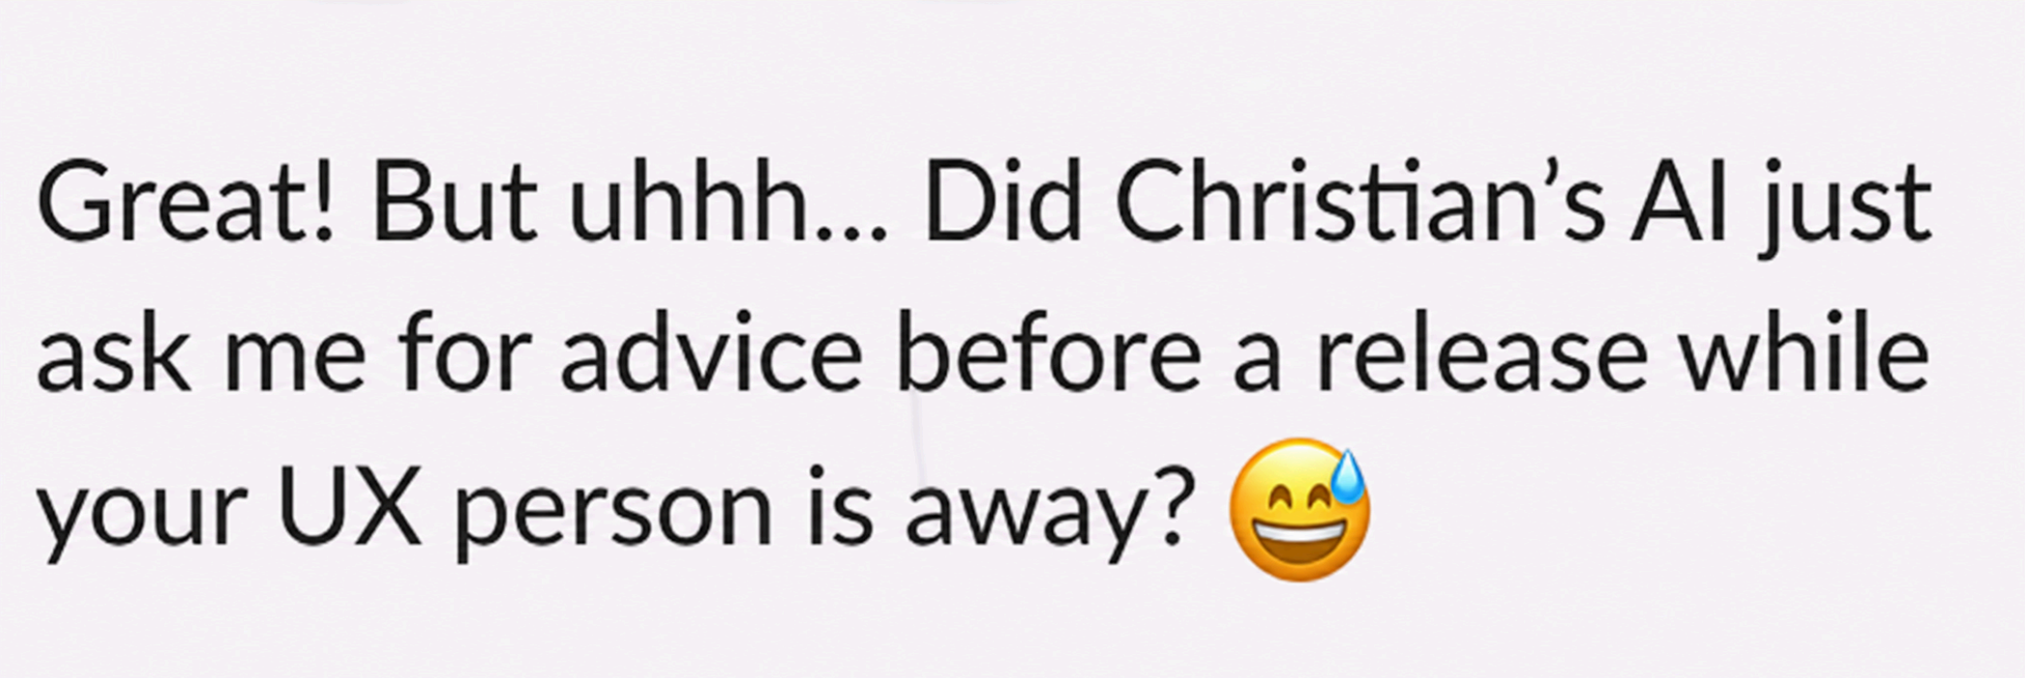

Translate

Translated from Swedish

“I can take a look in Duo once it is available there.”

Wait… was that Christian’s agent?

A colleague’s reaction · screenshot recreated in English

What context is still trapped in someone's head?

What becomes possible when colleagues and agents can both access it?

Christian Lizell · Athega / SVT · Thank you.
